

Q1: What is the main purpose of the study? A1: The main purpose of the study is to investigate the effects of the independent variable on the dependent variable.

Q2: What are the independent and dependent variables? A2: The independent variable is the variable that is manipulated or controlled by the researcher, and the dependent variable is the variable that is measured or observed.

Q3: How was the study conducted? A3: The study was conducted using a quantitative research design, involving a sample of participants who were exposed to different levels of the independent variable.

Q4: What were the results of the study? A4: The results of the study showed a significant positive relationship between the independent variable and the dependent variable.

Q5: What are the implications of the study? A5: The implications of the study suggest that the independent variable has a positive impact on the dependent variable, which has practical implications for the field of study.

Q6: What are the limitations of the study? A6: The limitations of the study include the use of a convenience sample and the lack of control over external variables.

Q7: What are the conclusions of the study? A7: The conclusions of the study are that the independent variable has a positive effect on the dependent variable, and that further research is needed to explore the underlying mechanisms.
