

Q: What are the key components of the system? A: The system is composed of several key components: the user interface, the database, the server, and the client. The user interface is responsible for providing a user-friendly way to interact with the system. The database stores and manages the data. The server handles the logic and processing of the system. The client is the software that runs on the user's computer to access the system.

Q: How does the system work? A: The system works by allowing users to interact with the database through the user interface. The server processes the requests and returns the data to the client. The client then displays the data to the user.
